Interpreting Algebraic Expressions

Mathematical goals
This lesson unit is intended to help you assess how well students are able to translate between words, symbols, tables, and area representations of algebraic expressions. It will help you to identify and support students who have difficulty in:

- Recognizing the order of algebraic operations.
- Recognizing equivalent expressions.
- Understanding the distributive laws of multiplication and division over addition (expansion of parentheses).

Common Core State Standards
This lesson involves mathematical content in the standards from across the grades, with emphasis on:

A-SSE: Interpret the structure of expressions.
A-APR: Rewrite rational expressions.

This lesson involves a range of mathematical practices, with emphasis on:

2. Reason abstractly and quantitatively.
7. Look for and make use of structure.

Introduction
The lesson unit is structured in the following way:

- Before the lesson, students work individually on an assessment task that is designed to reveal their current understanding and difficulties. You then review their work, and formulate questions for students to answer, to help them improve their solutions.
- During the lesson, students work in pairs and threes to translate between word, symbol, table of values and area representations of expressions.
- In a whole-class discussion, students find different representations of expressions and explain their answers.
- Finally, students return to their original assessment task, and try to improve their own responses.

Materials required

- Each individual student will need two copies of the assessment task Interpreting Expressions and a mini-whiteboard, pen, and eraser.
- Each pair of students will need a copy of Card set A: Expressions, Card Set B: Words, Card Set C: Tables, Card Set D: Areas, a glue stick, a felt-tipped pen, and a large sheet of paper or card for making a poster.
- If you think you will need to continue with the activities into a second lesson, provide envelopes and paper clips for storing matched cards between lessons.
- There are some projector resources to help with instructions.
- The card sets should be cut up before the lesson. Note that the blank cards are part of the activity.

Time needed
Approximately ten minutes for the assessment task, a one-hour lesson and ten minutes in a follow-up lesson (or for homework). All timings are approximate. Exact timings will depend on the needs of the class.
Before the lesson

Assessment task: Interpreting Expressions (10 minutes)

Have the students do this task in class or for homework a day or more before the formative assessment lesson. This will give you an opportunity to assess the work and to find out the kinds of difficulties students have with it. You will then be able to target your help more effectively in the follow-up lesson.

Give each student a copy of Interpreting Expressions. Introduce the task briefly and help students to understand what they are being asked to do.

\[ I \text{ want you to spend ten minutes working individually on this task.} \]

\[ Don’t\ text{ worry too much if you can’t understand or do everything. There will be a lesson [tomorrow] with a similar task that will help you improve.} \]

It is important that students are allowed to answer the questions without assistance, as far as possible.

If students are struggling to get started, ask them questions that help them understand what is required, but do not do the task for them.

Assessing students’ responses

Collect students’ responses to the task. Make some notes about what their work reveals about their current levels of understanding. The purpose of doing this is to forewarn you of the difficulties students will experience during the lesson itself, so that you may prepare carefully.

We suggest that you do not score students’ papers. The research shows that this will be counterproductive, as it will encourage students to compare their scores and distract their attention from what they can do to improve their mathematics.

Instead, help students to make further progress by summarizing their difficulties as a list of questions. Some suggestions for these are given on the next page. These have been drawn from common difficulties observed in trials of this lesson unit.

We suggest that you write your own lists of questions, based on your own students’ work, using the ideas in the table on page 3. You may choose to write questions on each student’s work. If you do not have time to do this, you could write a few questions that will help the majority of students. These can then be displayed on the board at the end of the lesson.
## Common issues:

**Student writes expressions left to right, showing little understanding of the order of operations implied by the symbolic representation.**

For example:

| Q1a | Writes $n \times 5 + 4$ (not incorrect). |
| Q1b | Writes $4 + n \times 5$. |
| Q1c | Writes $4 + n \div 5$. |
| Q1d | Writes $n \times n \times 3$. |

## Suggested questions and prompts:

- **Can you write answers to the following?**
  - $4 + 1 \times 5$
  - $4 + 2 \times 5$
  - $4 + 3 \times 5$

- **Check your answers with your calculator.**
  - How is your calculator working these out?

- **So what does $4 + n \times 5$ mean?**
  - Is this the same as Q1b?

**Student does not construct parentheses correctly or expands them incorrectly.**

For example:

| Q1b | Writes $4 + n \times 5$ instead of $5(n + 4)$.
| Q1c | Writes $4 + n \div 5$ instead of $\frac{4 + n}{5}$.
| Q2  | $(2n + 3) = 2n + 3$ is counted as correct.
| Q2  | $(5n)^2 = 5n^2$ is counted as correct.
| Q2  | $(n + 3)^2 = n^2 + 3^2$ is counted as correct.

- **Which one of the following is the odd one out and why?**
  - Think of a number, add 3, and then multiply your answer by 2.
  - Think of a number, multiply it by 2, and then add 3.
  - Think of a number, multiply it by 2, and then add 6.

**Student identifies errors but does not give explanations.**

In question 2, there are corrections to the first, third, and fourth statements, but no explanation or diagram is used to explain why they are incorrect.

- **How would you write down expressions for these areas?**
  - Can you do this in different ways?

![Diagram examples](image-url)
Suggested lesson outline

Interactive whole-class introduction (10 minutes)

Give each student a mini-whiteboard, pen and eraser. Hold a short question and answer session. If students show any incorrect answers, write the correct answer on the board and discuss any problems.

On your mini-whiteboards, show me an algebraic expression that means:

Multiply n by 4, and then add 3 to your answer. \[4n + 3\]
Add 3 to n, and then multiply your answer by 4. \[4(3 + n)\]
Add 5 to n, and then divide your answer by 3. \[\frac{n + 5}{3}\]
Multiply n by n, and then multiply your answer by 5. \[5n^2\]
Multiply n by 5, and then square your answer. \[(5n)^2\]

Collaborative activity: matching expressions and words (15 minutes)

The first activity is designed to help students interpret symbols and realize that the way the symbols are written defines the order of operations.

Organize students into groups of two or three. Display the projector resource, Matching Expressions and Words. Note that one of the algebraic expressions on the slide does not have a match in words. This is deliberate! It is to help you explain the task to students.

Model the activity briefly for students, using the examples on the projector resource.

I am going to give each group two sets of cards, one with expressions written in algebra, and the other with words.

Take it in turns to choose an expression and find the words that match it. [4(n + 2) matches “Add two to n then multiply by four”. 2(n + 4) matches “Add four to n then multiply by two”.]

When you are working in groups, you should place these cards side by side on the table and explain how you know that they match.

If you cannot find a matching card, then you should write your own. Use the blank cards provided. [4n+2 does not match any of the word cards shown on the slide. The word card “Multiply n by two, then add four” does not match any of the expressions.]

Give a copy of Card Set A: Expressions and Card Set B: Words to each small group. Support students in making matches and explaining their decisions.

As they do this, encourage students to speak the algebraic expressions out loud. Students may not be used to “talking algebra” and may not know how to say what is written, or may do so in ways that create ambiguities.

For example, the following conversation between a teacher and pupil is fairly typical:

Teacher: Tell me in words what this one says. [Teacher writes: \(3 + \frac{n}{2}\].]

Pupil: Three add n divided by two.

Teacher: How would you read this one then? [Teacher writes: \(3 + \frac{n}{2}\].]

Pupil: Three add n divided by two. Oh, but in the second one you are dividing it all by two.

Teacher: So can you try reading the first one again, so it sounds different from the second one?

Pupil: Three add… [pause] …n divided by two [said quickly]. Or n divided by two, then add three.
Collaborative activity: matching expressions, words, and tables (15 minutes)

Card Set C: Tables will make students substitute numbers into the expressions and will alert them to the fact that different expressions are equivalent.

Give each small group of students a copy of Card Set C: Tables and ask students to match these to the card sets already on the table. Some tables have numbers missing: students will need to write these in.

Encourage students to use strategies for matching. There are shortcuts that will help to minimize the work. For example, some may notice that:

Since \( 2(n + 3) \) is an even number, we can just look at tables with even numbers in them.

Since \((3n)^2\) is a square number, we can look for tables with only square numbers in them.

Students will notice that there are fewer tables than expressions. This is because some tables match more than one expression. Allow students time to discover this for themselves. As they do so, encourage them to test that they match for all \( n \). This is the beginning of a generalization.

Do \( 2(n + 3) \) and \( 2n + 6 \) always give the same answer when \( n = 1, 2, 3, 4, 5 \)?
What about when \( n = 3246 \), or when \( n = -23 \), or when \( n = 0.245 \) ?

Check on your calculator.

Can you explain how you can be sure?

This last question is an important one, and will be followed up in the next part of the lesson.

It is important not to rush the learning. At about this point, some lessons run out of time. If this happens, ask pupils to stack their cards in order, so that matching cards are grouped together, and fasten them with a paper clip. Ask students to write their names on an envelope, and store the matched cards in it. These envelopes can be reissued in the next lesson.

**Collaborative activity: matching expressions, words, tables, and areas (15 minutes)**

The *Card Set D: Areas* will help students to understand why the different expressions match the same tables of numbers.

Give each small group of students a copy of the *Card Set D: Areas*, a large sheet of paper, and a glue stick.

*Each of these cards shows an area.*

*I want you to match these area cards to the cards already on the table.*

*When you reach agreement, paste down your final arrangement onto the large sheet, creating a poster.*

*Next to each group write down why the areas show that different expressions are equivalent.*

These posters will be displayed in the final class discussion.

As students match the cards, encourage them to explain and write down why particular pairs of cards go together.

*Why does this area correspond to \( n^2 + 12n + 36 \)?*

![Diagram](image)

*Show me where \( n^2 \) is in this diagram. Where is \( 12n \)? Where is the 36 part of the diagram?*

*Now show me why it also shows \( (n+6)^2 \).*

*Where is the \( n + 6 \)?*

Ask students to identify groups of expressions that are equivalent and explain their reasoning. For example, E1 is equivalent to E10, E8 is equivalent to E9, and E4 is equivalent to E5.

**Plenary whole-class discussion (15 minutes)**

Hold a whole-class interactive discussion to review what has been learned over this lesson.

Ask each group of students to justify, using their poster, why two expressions are equivalent.

Then use mini-whiteboards and questioning to begin to generalize the learning.

*Draw me an area that shows this expression:* 

\( 3(x + 4) \)

*Write me a different expression that gives the same area.*
**Draw me an area that shows this expression:** $(4y)^2$

**Write me a different expression that gives the same area.**

**Draw me an area that shows this expression:** $(z+5)^2$

**Write me a different expression that gives the same area.**

**Draw me an area that shows this expression:** \( \frac{w+6}{2} \)

**Write me a different expression that gives the same area.**

---

**Review individual solutions to the assessment task (10 minutes)**

Return students’ work on the assessment task *Interpreting Expressions*, along with a fresh copy of the task sheet. If you chose to write a list of questions rather than write questions on individual papers, display your questions now.

*Read through the solution you wrote [yesterday] and think about what you learned this lesson.*

*Write a new solution, bearing in mind what you’ve learned, to see if you can improve your work.*

If you are running out of time you could postpone this activity until the next lesson, or set it for homework.
## Solutions

This table is for convenience only: it is helpful *not* to refer to cards by these letters in class, but rather to the content of the cards.

<table>

</table>
Interpreting Expressions

1. Write algebraic expressions for each of the following:

a. Multiply $n$ by 5 then add 4.  

b. Add 4 to $n$ then multiply your answer by 5.  

c. Add 4 to $n$ then divide your answer by 5.  

d. Multiply $n$ by $n$ then multiply your answer by 3.  

e. Multiply $n$ by 3 then square your answer.

2. Imagine you are a teacher. Decide whether the following work is correct or incorrect. If you see an error:

a. Cross it out and replace it with a correct answer.

b. Explain the error using words or diagrams.

$2(n + 3) = 2n + 3$

$\frac{10n - 5}{5} = 2n - 1$

$(5n)^2 = 5n^2$

$(n + 3)^2 = n^2 + 3^2 = n^2 + 9$
## Card Set A: Expressions
